

LOUVERS

Louvers are metal slats that regulate airflow and light in HVAC systems. They are often found on the outside of buildings and are a key part of a building's ventilation system.

How Louvers work:

- **Allow air to pass through:** Louvers are made of angled blades that allow air to pass through while blocking out water, debris, and other unwanted particles.
- **Protect from the elements:** Louvers can be watertight to keep out rain and other elements.
- **Reduce noise:** Louvers can help reduce the sound transmitted through ductwork.

OPTION:

Exchange Air: Straight Blades in combination with Angled Blades

Extruded Aluminum Louver – all custom sizes

- 4" deep
- 1" Flange
- Birdscreen
- 38 deg blades
